

GENETIC TOXICOLOGY SCREENING: A COVANCE PERSPECTIVE

Robert Smith

Covance Labs

3rd October 2018

Navigating drug discovery and development

Genetic Toxicology Screening: Rationale for Early Evaluation

- ▶ Screening allows early identification of potential genotoxicity
 - Focus time and resource on most promising compounds
 - Efficient planning for follow-up testing
 - Reduces 'surprises' in later development
- ▶ Advantages of screening assays
 - Reduced test article requirement (miniaturised designs)
 - Quicker turn-around time
 - Lower cost compared to regulatory assays
 - Predictive of regulatory tests
- ▶ One approach is to mimic the regulatory study as closely as possible for best predictivity
 - Design dependent on test article availability

CRO Perspective

- ▶ Historically, only GLP and Pre-GLP studies were outsourced to CRO
 - Early screening with mg of compound performed in-house
- ▶ Industry has moved towards outsourcing earlier in development
- ▶ This has created challenges and opportunities
 - Miniaturisation of regulatory assays with minimal compound (to predict GLP assay outcome)
 - Turn around times (TATs) for multiple clients
 - Client specific requirements (try to mimic in-house design/strategy)
- ▶ Streamlined process to provide high quality data with reduced TATs

Genetic Toxicology Screening Assays

- ▶ Most regulatory genetic tox assays can be scaled down for screening (to conserve test article, time, etc.)
- ▶ Screening should ideally cover gene mutation and chromosome damage
 - Bacterial Mutation Assay (Ames)
 - *In vitro* micronucleus
- ▶ Different designs based on availability of test article

Ames Screen: Abbreviated and Multi-Well Modifications

Format	Standard	6-Well	24-Well
Area	~500 mm ²	~90 mm ²	~20 mm ²
Maximum concentration	5000 µg/plate	1000 µg/well*	250 µg/well*
Compound per strain	40 to 50 mg per strain	15 mg per strain	3 mg per strain
*Equivalent to 5000 µg/plate			

► Strains TA98 and TA100 minimum screen

Ames: Standard v Multi-Well Screens

Historical Vehicle Control Data

- ▶ Ranges comparable between standard and multi-well
 - increased variability with multi-well assay (low revertant numbers)
- ▶ Recommendations/Considerations with low spontaneous revertant strains
 - Use strain TA97a in place of TA1537
 - Use strain WP2 *uvrA* pKM101 for *E.coli* strain
 - Use historical data to help assess biological relevance of small increases (e.g. strains TA98 and TA1535)

Strain	Revertant Numbers			
	Mean Revertants per Plate		99% Reference Range	
	Standard Ames	24-Well Ames	Standard Ames	24-Well Ames
TA98	24	2	10 to 46	0 to 7
	34	3	15 to 56	0 to 11
TA100	113	7	76 to 170	1 to 15
	123	7	81 to 157	0 to 15
TA1535	22	2	7 to 45	0 to 7
	18	1	9 to 34	0 to 4
TA1537	10	1	2 to 25	0 to 3
	18	1	7 to 30	0 to 4
TA97a	113	8	74 to 155	1 to 19
	184	10	105 to 249	3 to 19
TA102	270	25	185 to 362	15 to 40
	269	29	179 to 393	11 to 45
WP2 <i>uvrA</i> pKM101	171	15	121 to 241	7 to 25
	219	20	148 to 303	11 to 32

Ames: Standard v Multi-Well Screens

Positive/Negative Comparison

Ames Screens: Standard v Multi-Well Concentration by Concentration

90-mm vs 24-Well Plates, ICR-191

► Corresponding concentrations show good concordance (multi-well v standard Ames)

Ames Screens:

Pros / Cons

- ▶ Multi-Well modifications generally show good concordance to the standard plate assay
 - Outcome (positive / negative)
 - Concentration
- ▶ Current OECD initiative: Can mini-Ames formats be used as surrogate for Ames assay in certain circumstances?
- ▶ Can use the same strains
- ▶ Significantly less test article usage
- ▶ Target follow-up testing in specific strains to investigate equivocal results (increase replicate wells or in full plate)
- ▶ Considerations with low spontaneous revertant strains
 - Use appropriate strains
 - Use of historical ranges aids interpretation

In Vitro MN Screens: Abbreviated and 96-Well Formats

Format	Tube	96-Well
Volume	5 / 10 mL	150 μ L
Maximum concentration	1 mM / 500 μ g/mL Cytotoxicity limit for MN analysis	
Compound	50 to 200 mg	5 mg
Cells	Human PBLs or TK6, Mouse L5178	TK6

- ▶ Extended treatment, -S-9 & Short treatment +S-9 minimum
- ▶ Same cytotoxicity measures
- ▶ Other volumes and cell lines can be used
- ▶ Reduced BN cells (500 to 1000 per concentration)
- ▶ Semi-automated MN analysis using Metafer

In Vitro MN: Standard v 96-Well Historical vehicle controls

	MNBN Cell Frequency (%)			
	3+27 Hour +S9 (with Cyto B)		27+27 Hour -S9 (with Cyto B)	
	Standard TK6	Micro TK6	Standard TK6	Micro TK6
Mean	0.60	0.69	0.68	0.82
Observed Range	0.10 to 1.30	0 to 1.40	0.30 to 2.10	0 to 2.00
95% Reference Range	0.12 to 1.20	0.02 to 1.29	0.36 to 1.78	0.20 to 1.81

- Historical ranges comparable (96-well v standard tube format)

In Vitro MN: Standard v 96-Well Positive / Negative Comparison

Test Chemical	Expected Outcome	Actual Outcome				Comparison

Methyl Methanesulfonate	+	not tested	+	not tested	+	✓

- Good concordance between standard tube and 96-Well formats

In Vitro MN: Standard v 96-Well Scoring

- ▶ Good concordance between standard tube and 96-Well formats

In Vitro MN Screen: Manual v Metafer Analysis

Manual versus Semi-Automated Metafer Analysis

Metafer MSearch gallery showing MN analysis.

In Vitro MN Screen: Pros / Cons

- ▶ 96-well format generally show good concordance with standard tube based assay
 - Outcome (positive / negative)
 - Good concentration concordance
- ▶ Significantly less test article used
- ▶ Use of (semi-)automation reduces turn around times
- ▶ Fewer cells scored
- ▶ May not evaluate all three treatment conditions

Conclusion

- ▶ Early Screening allows earlier identification of genotoxic compounds
 - Saves valuable time and resource
- ▶ Miniaturised screens require significantly less test article
- ▶ Miniaturised screens have good concordance with corresponding regulatory assays

WHAT ARE THE NEXT STEPS FOR SCREENING...

- ▶ Future developments/techniques may improve turnaround time and provide additional relevant information with limited compound
- ▶ Automated micronucleus analysis
 - Automated image based platforms
 - Flow cytometry
 - Imaging flow cytometry (e.g. ImageStream)
- ▶ Additional/multiple endpoints – e.g. MultiFlow™
 - Aneugen, Clastogen or Non-genotoxic
 - Mode of Action

About Covance / Thank You

Covance Inc., headquartered in Princeton, NJ, USA, is the drug development business of Laboratory Corporation of America Holdings (LabCorp). COVANCE is a registered trademark and the marketing name for Covance Inc. and its subsidiaries around the world.
